Computational Mechanics

The purpose of this journal is to report original research of scholarly value and of reasonable permanence in those areas of computational mechanics which involve and enrich the rational application of mechanics, mathematics, and numerical methods in the practice of modern engineering. The scope of the research reported in this journal will include theoretical and computational methods, and their rational application, in: (a) solid and structural mechanics, multi-body system dynamics, constitutive modeling, inelastic and finite deformation response, structural control; (b) fluid mechanics and fluids engineering, compressible and incompressible flows, and aerodynamics; (c) fracture mechanics and structural integrity; (d) transport phenomena and heat transfer; and (e) modern variational methods in mechanics, in general.
